

ASSIGNMENT DAY-4

1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

- GPU Brand: Intel
- Model Number: Intel R Graphics
- Integrated

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

3.Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

FEATURE	Air Cooling System	Liquid Cooling System
Cost	Less Expensive	More Expensive
Cooling Efficiency	Good for daily life	Superior Performance
Maintenance	Low Maintenance	High Maintenance
Noise	Can get loud	Less Noise

4.Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

I would choose **liquid cooling for the GPU**. Liquid cooling is more efficient at removing heat, which is important when streaming IPL matches and playing graphics-heavy games at the same time, as both tasks put high load on the GPU. It also keeps temperatures more stable, reducing thermal throttling and improving performance. Although it is more expensive and complex than air cooling, the quieter operation and better cooling performance make it ideal for a high-end gaming and streaming setup.
